International Eastern Europe Conference “European Fisheries Fund and opportunities for fishery and aquaculture product processing”

Rīga, October, 2009.

Small fish for big profit

- Fish resources decrease in quantity and quality
- Even smaller fish becomes interesting for food industry
- Small fish takes different approach for processing

Law of quality

- Quality fish products starts at the catch
- One can just retain fish quality not rise
- The faster we are while moving to the next processing stage, the best results can be achieved

New approach from the very beginning

- Fish pumping instead of squeezing in nets and braking in boxes
- Fish pumping into production premises increases productivity

Grading is the very beginning

- Grading is an absolute prerequisite for industrial fish processing

Two options after grading:

grading:

1) Dosing and freezing

- Dosing can be done by weighing or volume
- Dosed blocks goes to freezing, then defrosted before next processing
- Small fish takes volumetric dosing for increased productivity

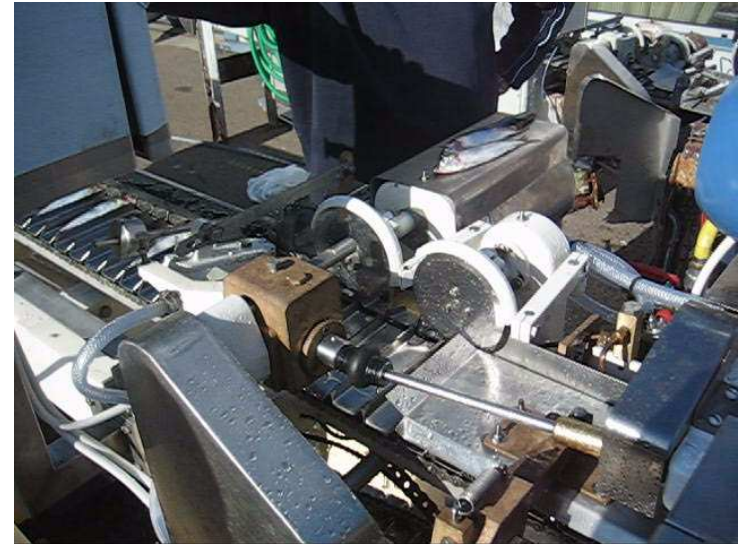

Two options after grading:

grading:

2) Industrial nobbing

- We recommend single fish processing for large and medium fish
- New PERUZA industrial nobbing technology is suitable for small fish productive processing

Thank you for attention!
